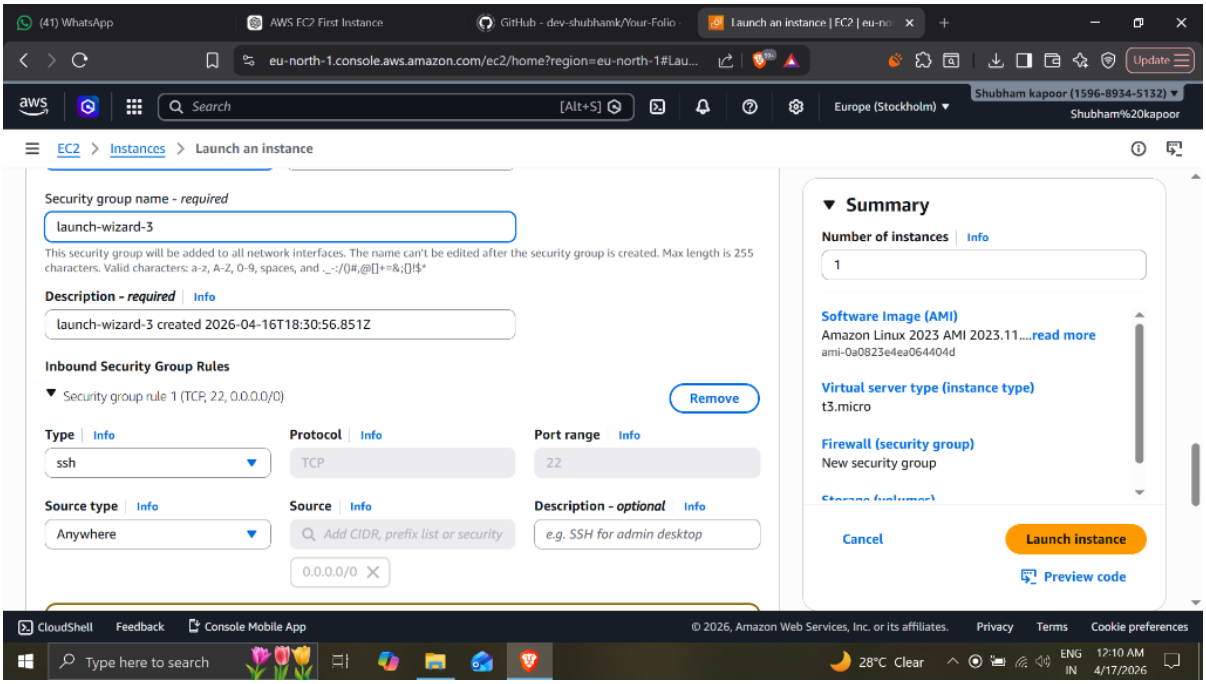
EC2 Instance Launch Practical

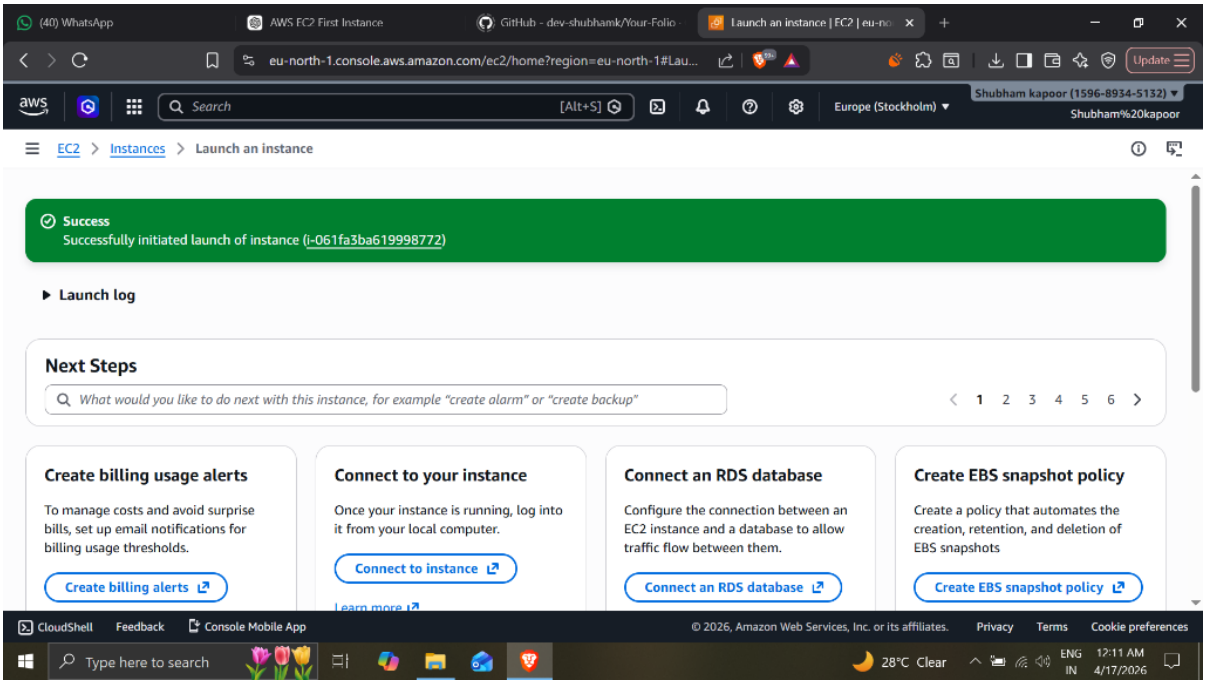
Step 1: Launching an EC2 Instance (Configuration)

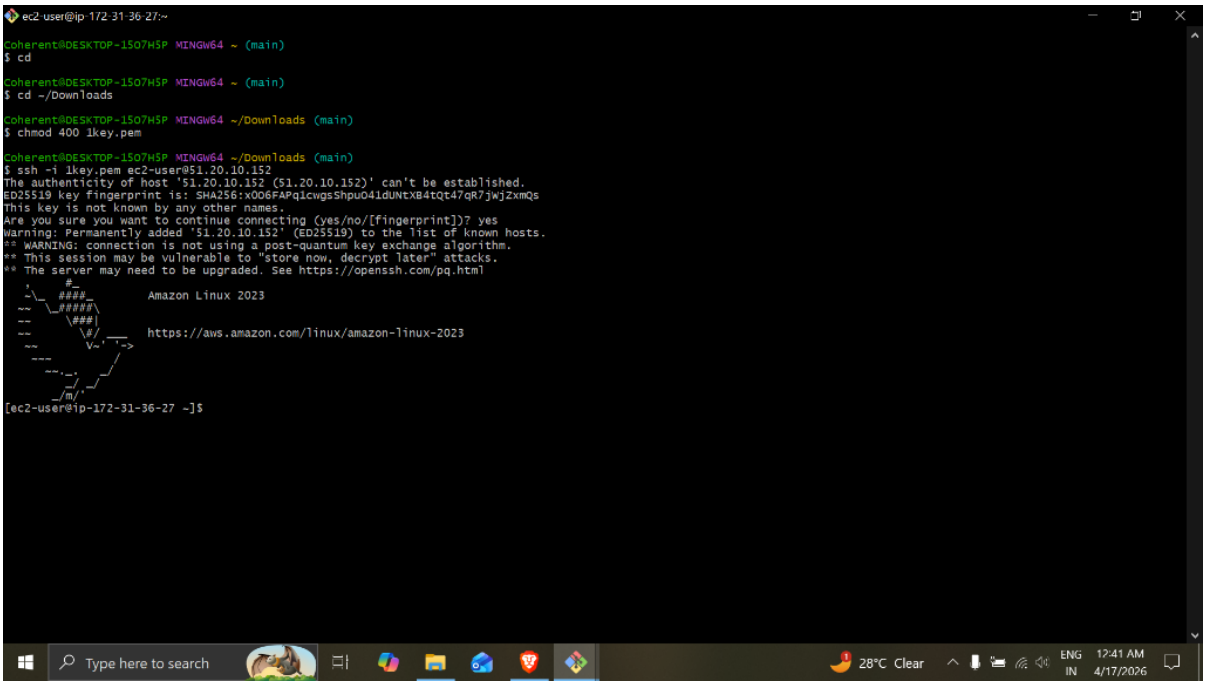
In this step, I navigated to the AWS EC2 console to launch a new instance.
- AMI used: Amazon Linux 2023 AMI
- Instance Type: t3.micro
- Security Group: Created a new security group "launch-wizard-3" allowing inbound SSH traffic (TCP port 22) from anywhere (0.0.0.0/0).



Step 2: Instance Launch Success

After configuring all required parameters, I initiated the instance launch. The screenshot confirms the successful initiation of the EC2 instance with ID i-061fa3ba619998772.



Step 3: Connecting to the Instance via SSH


Once the instance was running and had a public IP address allocated (51.20.10.152), I used Bash to securely connect to it.
- Key Pair: Used "1key.pem".
- Set permissions: "chmod 400 1key.pem"
- Connected: "ssh -i 1key.pem ec2-user@51.20.10.152"
